

WEEKLY DECISION MECHANISM

Automation Yield Review

A proposed operating artifact for connecting client promise, delivery, recurring run health, adoption, economics, capacity, risk, and reusable learning. It is a discovery hypothesis, not a representation of Automata's current internal process.

Review the portfolio to make decisions - not to manufacture a green status report.

1. PORTFOLIO DECISION BOARD

Work / client promise	Current state	Outcome evidence	Run and adoption evidence	Economics / capacity	Decision and owner
Illustrative workflow A	Commit / Watch / Hold / Recover / Reuse / Stop	What outcome is being validated?	Reliability, exception, use, human response	Cycle, support, skill, cost, reuse	Decision, owner, date, next evidence
Illustrative workflow B					
Illustrative workflow C					
Illustrative workflow D					

2. EXECUTIVE ATTENTION QUEUE

Trigger	Why it needs cross-functional attention	Decision standard
Client promise at risk	Delivery, technical, adoption, or communication issue could affect trust or outcome.	Containment, owner, client communication, recovery evidence.
Recurring exception	The same failure is consuming time or creating risk across runs or clients.	Root cause, rule/control change, verification, reuse.
Capacity conflict	Pipeline, delivery, support, and critical skills cannot all be satisfied as currently planned.	Reprioritize, staff, partner, rescope, reprice, or defer.
Reuse candidate	Repeated success may deserve a standard component, playbook, service, or product.	Common need, stable controls, economics, owner, productization test.

3. FIVE EVIDENCE VIEWS

Client value

What changed in the client's work? How is the claimed value measured, validated, and sustained?

Run health

What succeeded, failed, degraded, recovered, or required human intervention?

Adoption

Is the workflow actually being used and completed? Does the process owner trust it?

Economics

What are the delivery cycle, support burden, capacity demand, cost drivers, and reuse contribution?

Learning

What rule changed, failure was removed, pattern was packaged, or stop decision was made?

Evidence quality

Are definitions, baselines, units, owners, and source confidence clear enough to decide?

4. 60-MINUTE REVIEW AGENDA

Minutes	Focus	Output
0-5	Material changes since last review	Changed assumptions and urgent client/operating risk
5-20	Client promise and delivery decisions	Scope, escalation, ownership, acceptance, communication
20-35	Recurring run health and adoption	Recover, hold, control change, owner intervention
35-45	Capacity and economics	Priority, staffing, partner, pricing/service, defer
45-55	Reuse and learning	Productization test, standard work, training, stop
55-60	Decision readback	Owner, date, next evidence, client communication

5. DECISION RECORD

Decision	Why now	Owner	Next evidence	Date / review

The review should evolve with Automata's actual service model, financial structure, client commitments, technology stack, and governance requirements. It should be removed or redesigned if it creates reporting work without better decisions.
